Stock Trading App (MERN Stack)

Project Execution Documentation (23 Steps)

1. Install Required Software

Install VS Code, Node.js, Git, MongoDB Atlas account, Thunder Client/Postman, and Chrome. Verify Node.js and npm installation using `node -v` and `npm -v`. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

2. Create Project Folder

Create a root folder named Stock Trading with two subfolders: client and server to separate frontend and backend. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

3. Setup React Frontend

Use Vite to create the React app, install dependencies, React Router DOM, Axios, and run `npm run dev`. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

4. Setup Express Backend

Initialize Node.js in the server folder and install Express, Mongoose, CORS, dotenv, bcryptjs, jsonwebtoken, multer, and nodemon. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

5. Configure package.json

Add start and dev scripts so the backend can be started with `npm run dev`. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

6. Create Backend Folder Structure

Organize config, controllers, middleware, models, routes, uploads, utils, .env, and server.js. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

7. Configure MongoDB Atlas

Create a cluster, database user, network access, and obtain the MongoDB connection string. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

8. Create Database Connection

Implement config/db.js using `mongoose.connect()` and load the `MONGO_URI` from .env. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

9. Create Schema and Models

Define Mongoose schemas such as User.js with fields like name, email, and password. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

10. Create Controllers

Implement business logic including registerUser, loginUser, profile management, and validation. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

11. Create Routes

Create Express routers and map endpoints like /register and /login to controllers. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

12. Connect Routes

Register route files in server.js using app.use('/api/users', userRoutes). Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

13. Test Backend APIs

Use Thunder Client to send POST and GET requests and verify JSON responses. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

14. Build Frontend Structure

Create folders for components, pages, services, assets, and styles. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

15. Develop UI Pages

Develop Home, Login, Register, Dashboard, Portfolio, and other application pages. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

16. Configure Routing

Use React Router to navigate between application pages. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

17. Create API Service

Configure Axios with the backend base URL for API communication. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

18. Connect Frontend and Backend

Integrate registration, login, and data fetching through REST APIs. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

19. Develop Dashboard

Display user profile, stock information, portfolio, and wallet details. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

20. Implement Trading Features

Develop buy, sell, portfolio management, and transaction history features. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

21. Testing and Debugging

Test frontend, backend, database connectivity, API endpoints, and fix errors. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

22. Execute the Project

Run backend with `npm run dev` and frontend with `npm run dev` in separate terminals. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.

23. Final Verification and Documentation

Verify all modules work correctly, capture screenshots, prepare documentation, and submit the completed project. Include code verification, screenshots, and explanations for each stage in your report to demonstrate implementation and understanding.
